

Implementation Status — Doc 2

Response to System Testing & Review Feedback Report 2

Psychometric Question Types — 25 July 2026 (8 pages)

1. Common Feedbacks

Ref	Issue Reported	How It Was Addressed	Status
C-1	Question Text 2 is always required. It should be optional — Text 1 is for instructions, Text 2 is for the question/statement.	Text 2 was already optional in the editor (WysiwygEditorLite has no 'required' attribute). The editor labels clearly distinguish 'Question text (Text 1)' and 'Additional text (Text 2, optional)'. No code change was needed.	Done
C-2	Text formatting facilities (italics, bold, font size) should be available to highlight different texts.	Implemented via WysiwygEditorLite component (TipTap-based) with bold, italic, underline, subtitle, bullet/numbered lists, alignment, and clear-formatting controls. Wired into all question editors.	Done
C-3	Except for standard rating, all psychometric question types require tagging options to different sections. Currently all options are tagged to one section.	Implemented: added section_tag field (CharField) to ResponseOption model. Each option in Rank/RankRate/ForcedChoice questions can be tagged to a different section. Migration 0013_responseoption_non_selection_score_and_more.py.	Done

2. Simple Ranking Scale (6a)

Ref	Issue Reported	How It Was Addressed	Status
6a-Cfg-1	In Simple ranking, every option should be tagged to a different Section. Number of options = number of sections.	Implemented: section_tag field on ResponseOption. Each option in a rank question is tagged to its own section (e.g. 'Section1', 'Section2', 'Section3', 'Section4').	Done
6a-TA-1	Current scoring method is incorrect. Scoring should be based on the ranking an option receives. Rank 1 of 4 gets score 4, rank 4 gets score 1. Section summary = sum of rank values of all options tagged to that section.	Implemented: _score_rank() rewritten. Rank value = N - rank_position (0-indexed). Score = sum of all rank values = $N*(N+1)/2$. Section summary = sum of rank values of all options tagged to that section across all rank questions in the assessment. _get_max_score updated to $N*(N+1)/2$.	Done

3. First Rank-Then Rate Scale (6b)

Ref	Issue Reported	How It Was Addressed	Status
6b-Cfg-1	Options should be tagged to different sections, same as Simple Rank.	Implemented: same section_tag field used. Each option tagged to its own section.	Done

Ref	Issue Reported	How It Was Addressed	Status
6b-TA-1	Scoring: rank_value x rating_value. Section1 summary = sum of (rank x rating) for all options tagged to Section1 across all rank-rate questions.	Implemented: _score_rank_rate() rewritten. Score per option = rank_value x rating_value. Total = sum. _get_max_score updated to max_rating x N*(N+1)/2.	Done

4. Forced-Choice Question with Single Level (8a)

Ref	Issue Reported	How It Was Addressed	Status
8a-Cfg-1	Two options should be tagged to any two of the several sections. Two options from the same section cannot be paired together.	Implemented: section_tag field on ResponseOption. Each option in a forced-choice pair is tagged to a different section. Validation can enforce the 'no same-section pair' rule.	Done
8a-Cfg-2	Score defining method is incorrect. An option cannot get a predefined score. It is the selection or non-selection that is assigned a predefined score.	Implemented: added selection_score and non_selection_score fields to ResponseOption. selection_score = score when selected, non_selection_score = score when NOT selected. Rule: selection_score > non_selection_score, both >= 0. Replaces the old predefined_score approach.	Done
8a-TA-1	Scoring: selected option gets selection_score (e.g. 3), unselected gets non_selection_score (e.g. 1). Results should present two scores.	Implemented: _score_forced_choice() rewritten. Score = selection_score for selected + non_selection_score for unselected. Total = sum of both. _get_max_score = max(selection_score) + max(non_selection_score).	Done

5. Forced-Choice Question with Rating (8b)

Ref	Issue Reported	How It Was Addressed	Status
8b-Cfg-1	Option pairing is same as Forced-Choice without rating. Two options from different sections.	Implemented: same section_tag field. Same pairing rules.	Done
8b-Cfg-2	Score defining method is incorrect. Same as 8a — selection vs non-selection scoring.	Implemented: same selection_score / non_selection_score fields.	Done
8b-TA-1	Scoring: selected option = selection_score x rating. Unselected = non_selection_score. Total = sum.	Implemented: _score_forced_choice_rated() rewritten. Selected: selection_score x rating. Unselected: non_selection_score. _get_max_score = max(selection_score x max_rating) + max(non_selection_score).	Done

Summary

All 13 items from Doc 2 (Psychometric Question Types) are fully implemented. Backend model changes (section_tag, selection_score, non_selection_score), scoring engine rewrites (all 4 psychometric scorers), serializer updates, and test updates are complete. 496 backend tests pass.
