

System Testing & Review Feedback Report 2

Psychometric Question Types

Common Feedbacks:

Common Issue 1. Question Text2 (optional) is not available. It is always required. The first question text is to give instructions (or description about the question), and the second question text is to present the question (statement). See the screenshot, two question texts are jumbled up.

Common Issue 2. Text formatting facilities, such as italics, bold, font size, etc. should be available to highlight different texts.

7: Standard Rating Scale ☆ Bookmark

Read the statement below and give your response by rating it on a five-point scale. I am good at doing mathematical problems and calculations

1 2 3 4 5

Jumbled up

Common Issue 3. Except for the *standard rating type*, all other psychometric question types require tagging the options to different sections. Currently all options are tagged to one section (like standard type questions). See below *simple ranking type* for example from the CreateQn page. Detailed explanation is given for each Qn type.

Question title *

RSSQ 01.01

This title identifies the question in lists and previews. It is not shown to candidates.

Question text *

Read the following statement and rank the answer options as they are true in your case. If you give an option a Rank1 that means that option is most true in your case. If two rival groups, who are all your friends, fight often,

Items to Rank

1 Using my personal relationship, make them feel at ease and come to a compromise. Remove Section1

2 Get to the root of the issue and help them resolve any misunderstanding. Remove Section2

3 Ask them to be practical and get back to studies rather than fighting. Remove Section3

4 Initiate an idea that will get them together and work for something meaningful. Remove Section4

PREVIEW

Question-Specific Feedbacks:

1 . Simple Ranking Scale

1. Admin User >> CreateQn >> Simple Ranking Scale Qn (Ref: *Career Judge_ Question Types Details, page 17, Section 6a*)

Issue 1. In Simple ranking question every option should be tagged to a different Section (already explained above). If a ranking type question takes 4 options, there should ONLY be four sections, and each option will be tagged to one of these sections. Ref: *Career Judge_ Question Types Details, page 17, Section 6a*

6(a). Simple Ranking Scale

Scoring: (1-n) – Each option in the RANK LIST is ranked, and an option takes the maximum score for the highest ranking and the minimum (1) score for the lowest ranking. Thus if there are 4 options under a question, the option that is ranked 1 (highest) receives a score of 4; the second option which is ranked as 2 (2nd highest), receives a score of 3; and so on. The last ranked option gets a score of 1.

Number of options to be included in a question is defined at the time of question creation, based on the number of SECTIONS (from the Item Bank) included in the assessment. Thus if four sections are included in the assessment, the number of options in the question is 4.

Each option is **TAGGED** to one of the selected Sections. Thus in a FOUR-OPTION question, each option is tagged to one of the 4 sections.

2. Admin User >> TakeAssessment >> Simple Ranking Scale Qn (Ref: *Career Judge_Question Types Details, page 17, Section 6a*)

Issue 1. Current scoring method is incorrect. Scoring should be based on the ranking an option receives. Suppose, Option 1 is tagged to Section 1, and the test taker selects this option in the first rank, then it receives a score of 4 in a four-section four-option assessment. (Note: Number of options in the ranking scale is always equal to the number of sections, and vice versa.) Section1 summary score will be the sum of rank values received by all options of all ranking questions tagged to that section in the assessment. Similarly, if Option 2 is tagged to Section 2, and the option receives the fourth rank, then it receives a rank value of 1. Sum of rank values of all options (in all ranking questions) tagged to Section 2 will make the summary score for that section. Following diagram illustrates the scoring method using two rank questions.

Note: Qn1-option1 and Q2-Option3 belong to Section 1 in the assessment. Therefore, corresponding rank values 4 (Qn1-option1) and 4 (Q2-Option3) are summed up to arrive 8. Similarly, Qn1-Option2 and Qn2-Option4 belong to Section 2. Corresponding rank values 1 (Qn1-Option2) and 1 (Qn2-Option4) are summed up to get a summary score of 2. (Same computation method is applied to other two sections also)

Alternatively, if a Rank-scale assessment has 5 options in a question, then it should have corresponding 5 sections. If there are 6 options, then there should be 6 sections.

The score summary shown below from a Simple Rank Scale assessment session is incorrect. (The logic of the scoring method is not clear.)

Score Summary		
TOTAL SCORE	PERCENTAGE	STATUS
6.0	100.0%	Passed

2 . First Rank-Then Rate Scale

1. Admin User >> CreateQn >> First Rank-Then Rate Scale Qn (Ref: *Career Judge_Question Types Details, page 18, Section 6b*)

Issue 1. As in the case of *Simple Rank Scale* question, options in a *First Rank-Then Rate* question should also be tagged to different sections. The rule of '*number of options = number of sections*' is applied here also.

Question type *	Category	Difficulty	Cognitive level
6b: Rank-then-Rate	Section 3 > Subjecti	Select...	Select...

2. Admin User >> Take Assessment >> First Rank-Then Rate Scale Qn (Ref: *Career Judge_Question Types Details, page 18, Section 6b*)

Issue 1. Current scoring method is incorrect. Scoring should be based on the ranking and rating an option receives. Suppose, in a four-section four-option assessment, Option 1 is tagged to Section 1, and the test taker selects this option in the first rank (ranking value = 4) and give a rating of 5, then it receives a score of $(4*5 = 20)$. Section1 summary score will be the sum of rank values multiplied by rating values received by all options of all ranking questions tagged to that section in the assessment. The diagram illustrates the method using two rank-rate questions.

6(b). First Rank-Then Rate Scale

Scoring: (1-n) – The scoring takes a **TWO-LEVEL PROCESS** in which the candidate ranks an option first and then gives a rating on the second level. In order to arrive an option's score, its respective rank score and rating score has to be multiplied. Thus, an option which receives 'Rank 1' (in a 4-option Question) and a rating of 6 on a 7-point scale, will receive a final score of 24 ($4 \times 6 = 24$). The maximum score for an option is 28 ($4 \times 7 = 28$).

The two-level process asks the candidate to select an option and rank it first by selecting a certain rank from the rank option shown on the **RANKING POPUP**. Second he has to click on the **RATING BUTTON**, just adjacent to the rank button, and select a certain rating option. Each option is thus ranked and given a rating, providing two types of scores: **RANK SCORE** and **RATING SCORE**. These scores are multiplied to arrive at the final score. If there are four options, there will be four sets of rank scores and rating scores.

Number of options to be included in a question is defined at the time of question creation, based on the number of **SECTIONS** (from the Item Bank) included in the assessment. Thus if four sections are included in the assessment, the number of options in the question is 4. Similarly, the extent of the rating scale is also defined at the time of question creation.

Each option IS TAGGED to any one of the FOUR SECTIONS in the assessment.

RANKING POPUP appears on clicking the RANK button

3 . Forced-Choice Question with Single Level

1. Admin User >> CreateQn >> Forced-Choice Question Qn (Ref: Career Judge_Question Types Details, page 20, Section 8a)

Issue 1. In *Forced-Choice question* the two options should be tagged to any two of the several sections in the assessment. A section may have many options, and each option in the section is paired to a forced-choice question as one of the two options. Thus, options from all different sections are paired to any of the questions.

Rule: Two options from the same section cannot be paired together to a question.

Currently, both options are tagged to a single category at the time of question creation. See the screenshot below.

Create Question

Create a new question with full type-specific configuration.

Question type *	Category	Difficulty	Cognitive level
Ba: Forced-Choice ~	Forced Choice Section	Select...	Select...

Issue 2. Score defining method as shown in the screenshot below is incorrect. An option cannot get a predefined score (this is true in standard question types), but it is the selection or non-selection of an option that is assigned a predefined score. In other words, the basis of scoring is the selection or non-selection of an option by the test taker. Detailed description is given below.

Option Pairs (exactly 2 options per question)

Each forced-choice question has exactly 2 options. Set predefined scores for each.

Planned and organized	Predefined score	Remove
	1	

Spontaneous and offhand	Predefined score	Remove
	3	

PREVIEW

Choose one of the options to answer the question below. What better describes your speech style?

☐ Planned and organized score: 1

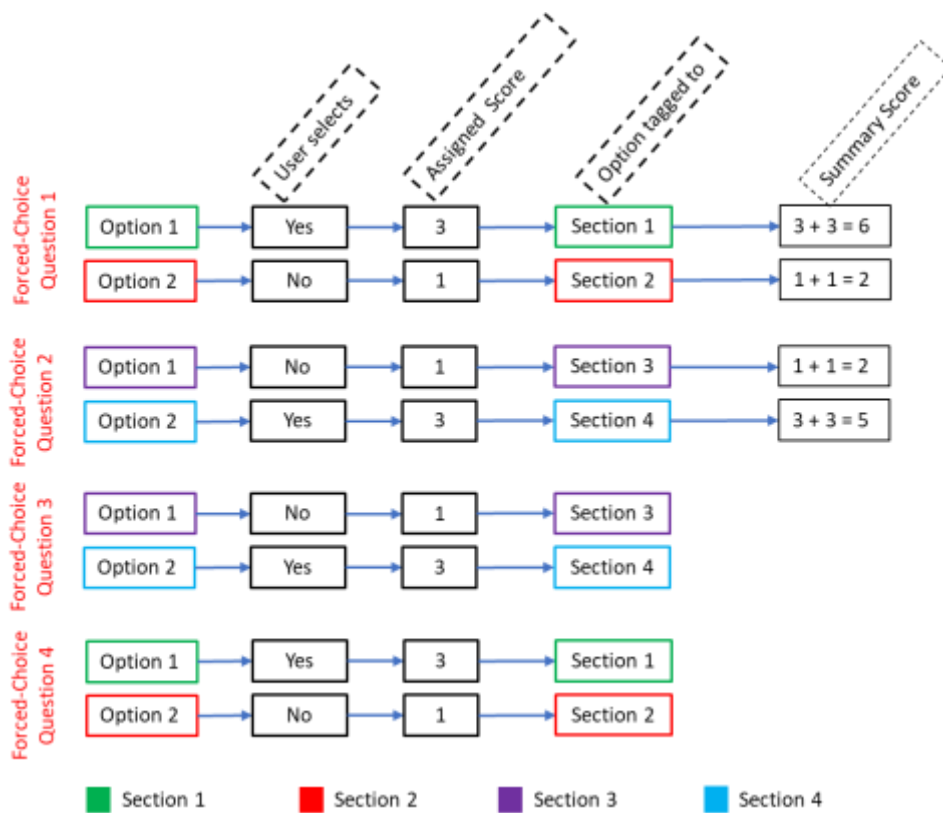

☐ Spontaneous and offhand score: 3

2. Admin User >> TakeAssessment >> Forced-Choice Question Qn (Ref: Career Judge_ Question Types Details, page 20, Section 8a)

Issue 1. Current scoring method is incorrect. Scoring should be based on the selection of an option from a forced-choice pair by the test taker. Every time an option from the forced pair is selected, then the selected option receives a score value (e.g., 3). If an option from the pair is not selected, it receives a lesser score value (e.g., 1). Suppose, if an option from Section1 in paired question is selected, then it receives a score of 3, and other unselected option from Section2 receives a score of 1. If scores for selection and non-selection are not predefined, the default score of 1 is given to selection and zero to non-selection. The user can assign any value except negative values.

Rule : Selection score should always be more than Non-selection score. Both selection and non-selection score should not be negative.

The following diagram illustrates the process:

Note: There are four sections, and each section has two options. Total options are therefore 8. An option from a section can be paired/tagged to any forced-choice question, except that two options from the same section should not be paired to the same question.

The current scoring method is unclear and incorrect. See the screenshot below. The results should present two scores one for selected option and the other for the non-selected option. But it shows only one.

Score Summary

TOTAL SCORE	PERCENTAGE	STATUS
1.0	33.3%	Below threshold

4 . Forced-Choice Question with Rating

1. Admin User >> CreateQn >> Forced-Choice Question with Rating (Ref: Career Judge_ Question Types Details, page 21, Section 8b)

Issue 1. Option pairing is same as in the case of *Forced-Choice question without rating*. Currently both options of a paired question are tagged to one section. That is incorrect. The test taker can give a rating only to the selected option.

Rule: *Two options from the same section cannot be paired together to a question.*

Issue 2. Score defining method as shown in the screenshot below is incorrect. As explained above, an option cannot get a predefined score, but it is the selection or non-selection of an option that is assigned a predefined score.

Rating scale points (Level 2)

5

Option Pairs (exactly 2 options per question)

Each forced-choice question has exactly 2 options. Set predefined scores for each. Candidate selects one, then rates it.

PREVIEW

Choose one of the options to answer the question below. What better describes your style?

☐ Speak in details and particulars

☐ Speak in generalities and subtleness

After selecting, candidate rates on 5-point scale. Final = predefined $\times$ rating.

2. Admin User >> CreateQn >> Forced-Choice Question with Rating (Ref: *Career Judge_Question Types Details, page 21, Section 8b*)

Issue 1. Current scoring method is incorrect. As in the case of *One-level Forced-Choice* question, scoring should be based on the selection of an option from a forced-choice pair by the test taker. Follow the scoring method of one-level forced choice question for the selection Vs. non-selection scoring. In order to get the selected option's final score, multiply the selection score by its rating score.

Rule : Selection score should always be more than Non-selection score. Both selection and non-selection score should not be negative.

The following diagram illustrates the process:
